

Train of thought

Game Identity / Mantra:

List your single sentence description of the game that you will use to guide design decisions.

(Example: *Stylized action platformer about a meatball fighting the dinner table.*)

Stylized walking simulator about a guy trying to escape the loop of taking the train everyday.

Design Pillars:

Walking simulator.

Puzzle solving/Clue search.

Bizarre.

Genre/Story/Mechanics Summary:

List what the game is from a gameplay and/or story perspective. (Example: *This game uses a unique swinging rope mechanic to tell a story about what it means to be a meatball...*)

The game uses wagons as playable levels. For some reason the metro/train is never stopping and you have to figure out what's going on. The goal of the game is to advance the train from the last wagon to the first one but every time you try to do so you "teleport" to the same wagon.

In order to advance to the next wagon you need to do certain things/solve puzzles that don't make a lot of sense.

Examples:

1. In a wagon a passenger has a problem, maybe they lost something. You need to find it in order to advance. The item might be on a weird spot
2. At some point the player has to climb on top of the wagon in order to jump into the next one to advance.
3. A dark wagon where you cannot really see very well at times. The lightning can be switched on every 5 seconds. The goal of this Wagon is to advance without colliding with a lot of obstacles. If you make too much noise , the guard will kick you and you have to restart again.

Features:

List the cool features or unique elements that you want to include in your game.

- Short comedic gags.
- With limited visibility using the camera perspective and stencils , the player has to explore all the corners of the wagon.
- A character that is seen in most of the wagons that tells a story of what's going on.
- Animals. (Palomas)

- Everytime the player tries to advance to the next wagon it comes back to the last wagon he was in.
- The background where the player is advancing changes, to let the player know he's advancing. Starts underground, Goes outside with a city background, forest background,

Interface:

List the player input method, the controls, and how the player interacts with your game.

A D lateral movement.

W S up and down movement.

E to interact with environment/people.

Art Style:

2.5D, you see the train sideways, and the visibility is limited to a bubble around the player.

The background is implemented using the parallax technique as seen on the figure above. The camera distance can change between wagons to give unique feels.

In order to give it a unique look. A cartoon shader can be used.

The lightning also changes through the wagons.

The wagons that are underground need a lot of artificial light coming from above.

The wagons that are outside have natural light coming from outside (Only if daytime).

Music/Sound:

Include links to music and sound design similar to What you're trying to achieve. You can also list the emotional responses that the sound should invoke in the player.

Quiet background sound of a train going in the rail.

A rewarding noise everytime the player resolves the enigma of the wagon and can advance to the next one.

Development Roadmap / Launch Criteria:
